Amendment to the Claims:

Please amend claims 1-16 as follows:

- 1. A heat exchanger, comprising: (Currently Amended)
- modules defining a first path for a first fluid, each of said modules comprising two metal sheets forming between them a network of channels which are located in parallel with each other from the a fluidic point of view, each channel interposed between two neighbouring channels of the network being, over the whole of its developed length of said modules, each adjacent channel of said network of channels being to these two neighbouring channels from which it is isolated by two respective weld lines connecting the said two metal sheets;
- a second path for a second fluid is defined between the said modules; wherein and an overall variation in a passage cross-section varies over the a length of at least one of the said first and second paths with continuity of profiles of the said channels.
- 2. (Currently Amended) A heat exchanger according to claim 1, characterised in that-thewherein a pitch between the neighbouringsaid respective weld lines varies progressively over at least part of the a length of the said channels of one of said module modules.

Serial No. 10/585,601

Office Action dated: March 5, 2010 Amendment A dated: June 7, 2010

- 3. (Currently Amended) A heat exchanger according to claim 1, eharacterised in that the wherein an inflation of the metal sheets of a one of said modules module varies progressively over at least part of the a length of the said channels.
- 4. (Currently Amended) A heat exchanger according to claim 1, characterised in that the wherein a pitch between neighbouring said respective weld lines varies from one channel to another of said channels the other of a module.
- 5. (Currently Amended) A heat exchanger according to claim 1, characterised in that the wherein an inflation of the metal sheets of a one of said modules module varies from one of said channels channel to another of said channels.
- 6. (Currently Amended) A heat exchanger according to claim 1, characterised in that the wherein an arrangement of the said modules in relation to each other produces an overall variation in the a passage cross-section over the a length of the said second path.

Office Action dated: March 5, 2010

Amendment A dated: June 7, 2010

7. (Currently Amended) A heat exchanger according to claim 1, characterised in that wherein an the overall variation in the a cross-section of one of the said first and second paths is in the same direction ascorresponds to a variation in the a flow rate of gas in this pathsaid one of said first and second paths intended for a phase change process.

- 8. (Currently Amended) A heat exchanger according to claim 1, characterised in that the wherein said modules are in parallel planes.
- 9. (Currently Amended) A heat exchanger according to claim 1, characterised in that thewherein said modules are in convergent planes.
- 10. (Currently Amended) A heat exchanger according to claim 1, characterised in that the wherein said modules have longitudinal edges forming an angle with each other, each of said edges being almost parallel to a respective outside weld line.

Serial No. 10/585,601

Office Action dated: March 5, 2010 Amendment A dated: June 7, 2010

11. (Currently Amended) A heat exchange module, comprising:

two metal sheets which between them form a network of channels located in parallel to each other from a fluidic point of view,—each channel interposed between two neighbouring channels of the network being adjacent over its the whole developed length to these two neighbouring of said channels, each of said channels being from which it is isolated by two respective weld lines joining the said two metal sheets, and wherein an overall variation in thea passage cross-section is defined by the—said channels with continuity of profile of the—said channels.

- 12. (Currently Amended) A heat exchange module according to claim 11, characterised in that the wherein a pitch between neighbouring said respective weld lines varies progressively over at least part of the a length of the said channels.
- 13. (Currently Amended) A heat exchange module according to claim 11, characterised in that the wherein an inflation of the said metal sheets varies progressively over at least part of the length of the said channels.

Serial No. 10/585,601

Office Action dated: March 5, 2010 Amendment A dated: June 7, 2010

- 14. (Currently Amended) A heat exchange module according to claim 11, characterised in that the wherein a pitch between the neighbouring said respective weld lines varies from one channel the other to another of said channels.
- 15. (Currently Amended) A heat exchange module according to claim 11, characterised in that the wherein an inflation- of the metal sheets varies from one channel to the other another of said channels.
- 16. (Currently Amended) A heat exchange module according to claim 11, <u>further comprising characterised in that it comprises</u> longitudinal edges—each forming an angle with the each other, each <u>of said edges</u> being <u>almostsubstantially</u> parallel to <u>a respective outside line of weld at least one of said respective weld lines.</u>
